

The chart displays the distribution of Android versions across a large sample of devices over time. The y-axis represents the proportion of devices, ranging from 0.0 to 1.0. The x-axis represents the date, with labels every four months from October 2011 to June 2014. The legend on the right lists Android versions 7 through 20, each associated with a specific color. The chart shows that as newer versions are released, the proportion of devices running older versions decreases. For example, the proportion of devices running Android 7 (yellow) starts at approximately 0.1 in October 2011 and drops to near zero by mid-2013. Conversely, the proportion of devices running the latest version (20, dark blue) starts at zero and increases to approximately 0.1 by mid-2014.
