

This stacked area chart illustrates the distribution of Android versions across a large sample of devices over time. The y-axis represents the proportion of devices, ranging from 0.0 to 1.0. The x-axis shows dates from October 2011 to June 2014. The legend on the right identifies 19 different Android versions, each represented by a unique color. The chart shows that as newer versions are released, the proportion of devices running older versions decreases. For example, version 1 (dark blue) starts at a high proportion in late 2011 but drops to near zero by early 2012. Conversely, version 19 (dark red) starts at a low proportion and increases significantly over time, becoming the most common version by mid-2014.
